

Dashboard Guide

370 verified smart money wallets on Base
Real trades. Real data. Verifiable on-chain.

This guide covers every page of the dashboard.
What each number means. What to look for.

The Numbers

Every figure below is calculated from real on-chain data and verifiable OHLCV price feeds.

370 Wallets tracked	132K+ Trades indexed
107 Signals backtested	54% Hit +20% in 30d

Top wallet in the database:

94.6%	+102.6%	37
Win Rate	ROI 30d	Closed Trades

Every trade is verifiable. Open the wallet in the dashboard, click 'View on Basescan'.

Dashboard Pages

■ Live Opportunities

[/ \(Home\)](#)

- Main feed — tokens smart money is currently accumulating
- Each card shows: how many wallets bought, total volume, time since first buy
- Urgency badges: NEW (< 2h), HOT (2–12h), ACTIVE (12–48h)
- Opportunity Score 0–100: higher = more wallets, more capital, better wallet history
- Sort by: Opportunity Score (default), Volume, Wallet Count, Recency
- Click any token card to see which specific wallets are buying it

■ Smart Money Clusters

[/clusters](#)

- Deeper view of accumulation events — groups of wallets moving together
- Filter: Accumulating vs Exiting (smart money selling is a signal too)
- Each cluster shows member wallets with their individual Alpha Scores
- The more high-score wallets in a cluster, the more meaningful the signal
- Timeline shows when each wallet entered — spread-out buys are more reliable than a single block

■ Signal History

[/signal-history](#)

- All signals ever detected, sorted by date
- See how each signal performed over time
- Filter by token, date range, outcome
- Use this to understand the historical accuracy of specific wallet clusters

■ Signal Proof

</proof>

- Backtested results: every signal measured against real OHLCV price data
- Entry price = price at time of first smart money buy
- Peak gain = highest price within 30 days after signal / entry price
- Current = today's price vs entry (can be negative)
- 54% of signals hit +20% within 30 days — this is the honest number
- Use this page before trusting any new signal: check the wallet's historical hit rate

■ Leaderboard

</leaderboard>

- 370 wallets ranked by Alpha Score (default), Win Rate, or ROI 30d
- Alpha Score combines: ROI + Win Rate + Consistency + Activity - Drawdown
- Green badge = active in last 7 days
- Click any wallet to open their full Wallet Profiler
- Top 10 wallets are the ones worth following most closely

■ Wallet Profiler

</profile>

- Enter any Base wallet address in the search bar
- Alpha Score shown with full breakdown (see Score Guide section below)
- Stats: Win Rate, ROI 30d, Closed Trades, Total Txns, Days Active, Fail Rate
- DNA Radar: 6-axis visualization — Consistency, Alpha, Risk Control, Volume, Capital, Smart Money
- Archetype: The Oracle / Diamond Hands / Degen Trader / Whale / etc.
- Recent Trades tab: actual buy/sell history with P&L; per trade
- Holdings tab: current open positions with unrealized P&L;
- View on Basescan link: verify everything independently

■ Hidden Gems

</hidden-gems>

- Tokens that smart money is accumulating quietly — low Twitter noise, real buying
- Filtered for: low market cap, growing wallet count, no recent hype
- Risk Score shown for each token (see Token Scanner below for score breakdown)
- These are earlier-stage signals — higher risk, higher potential upside

■■ Token Audit

</audit>

- Enter any Base token contract address
- GoPlus Security API check: honeypot detection, contract ownership, trading restrictions
- DexScreener data: liquidity, volume, price action, holder count
- Red flags section: lists specific risks found in the contract
- Use before entering any position — 2 minutes to run, potentially saves your capital

■ Token Scanner

</scanner>

- Browse all tokens currently being tracked across 370 wallets
- Risk Score 0–100 for each token (75+ = safe, 50–74 = caution, below 50 = danger)
- Click '▼ why?' on any token to see the exact factors affecting its score:
 - Liquidity: is there enough depth to enter/exit without slippage?
 - Volume: is the volume real or thin?
 - Price action: stable, pumped, or dumping?
- Sort and filter by risk level, volume, wallet count

■ Alerts

[/alerts](#)

- Configure Telegram alerts for smart money cluster events
- Step 1: Create a bot via @BotFather in Telegram (free, takes 2 min)
- Step 2: Get your Chat ID (paste your bot token, send /start, fetch getUpdates URL)
- Step 3: Paste both into the Alerts page, click Test Alert
- Step 4: Toggle Auto-alerts ON
- Alert format: token name, wallet count, total volume, top wallet score, link to dashboard
- Minimum wallets threshold: set to 5+ to filter noise, 10+ for high-conviction only

■ System Status

[/status](#)

- Real-time health check for all external APIs
- Green dot = API responding normally, Red dot = issue detected
- APIs monitored: Blockscout, DexScreener, GeckoTerminal, GoPlus
- Database stats: total wallets, trades, signals, last sync time
- Recent syncs table: which wallets were updated and when
- If something looks wrong in the dashboard, check this page first

■ Wallet Discovery

[/discovery](#)

- Finds new wallets that may be smart money — not yet in the tracked database
- Algorithm: looks for wallets that consistently entered tokens before major moves
- Run discovery to expand the tracked wallet list
- Review candidates before adding: check their Alpha Score and trade history
- This is how the database grew from 10 wallets to 370

Alpha Score — Full Breakdown

The Alpha Score is calculated from real FIFO trade data. Every component is verifiable.

ROI Component

up to 37 pts

Based on 30-day return on investment across all closed trades. Scaled: +100% ROI = ~37 pts. Negative ROI = 0 pts. This is the heaviest weight — a wallet that makes money gets the most credit.

Win Rate Component

up to 30 pts

Percentage of closed trades that were profitable. 100% win rate = 30 pts. 50% = 15 pts. Calculated on closed positions only — open positions don't count until they close.

Consistency Component

up to 20 pts

Measures whether the wallet wins steadily or just had one lucky trade. A wallet with 10 profitable months scores higher than one with 1 exceptional month. High consistency = reliable signal source.

Activity Component

up to 13 pts

Rewards active wallets. A wallet that hasn't traded in 90 days may be stale. This component decays with inactivity. 13 pts = trading regularly in the last 30 days.

Drawdown Penalty

up to -8 pts

Penalizes wallets that take large losses. A wallet with a -80% drawdown on any single trade loses up to 8 points. This catches 'win rate gamers' who hide large losses.

Reading the Score

90–100	Elite	Top 5% of all wallets. These lead clusters.
75–89	Strong	Reliable signal source. Follow their clusters closely.
50–74	Average	Some good trades, some bad. Use as supporting signal only.
0–49	Weak	Inconsistent. Don't use as primary signal source.

How to Use WalletDNA

Daily workflow

1

Check Live Opportunities /

Open the home feed. Look for tokens with 10+ wallets and NEW or HOT badges. These are active clusters — smart money moved in recently.

2

Verify the wallets /leaderboard or /profile

Click the token card to see which wallets are buying. Check their Alpha Scores. A cluster of 80+ score wallets is very different from a cluster of 40-score wallets.

3

Check the token /scanner or /audit

Run a quick risk check on the token. Is the liquidity real? Is the contract clean? Takes 60 seconds. Can save your capital.

4

Check Signal Proof history /proof

Has this type of cluster worked before? Filter by similar wallet counts and check past performance. Not a guarantee — but context matters.

5

Set an alert /alerts

If you want to track this token going forward — or get notified when the next similar cluster forms — make sure your Telegram alert is configured.

Tips

Focus on clusters with 10+ wallets. Single wallet buys are noise.

A cluster led by 90%+ win rate wallets is far more meaningful than one led by 40% wallets.

Signal Proof shows 54% hit +20%. That also means 46% didn't. Size accordingly.

Telegram alerts are fire-and-forget. Set them up once, they come to you.

Verify every wallet on Basescan before acting. The link is on every profile.

Troubleshooting

Dashboard not loading — Make sure start.bat (Windows) or start.sh (Mac) is still running.

No opportunities showing — The indexer syncs every 60 minutes. First sync takes a few minutes after launch.

Telegram alert not working — Check Bot Token format (numbers:letters). You must send /start to your bot before fetching the Chat ID.

Profile shows — for win rate — That wallet has not been synced yet. It will appear after the next automatic sync cycle.

Something looks wrong? — Check /status page first. It shows which APIs are up and when wallets were last synced.

WalletDNA is an informational tool. Nothing in this product is financial advice. On-chain data shows what wallets are doing — it does not predict future price movements. Smart money can be wrong. Always do your own research.
